

Gurinder Singh

Senior Staff Engineer

Applied AI / ML

I build the AI infrastructure that lets PayPal's autonomous merchant programs ship.

<i>Current role</i>	Staff Software Engineer
<i>Team</i>	Pay With Venmo · Bazaar · DTVZ
<i>Manager</i>	Iliya Koreshev
<i>Scope today</i>	Venmo · SMB-FS · AI Labs · Devmo
<i>Email</i>	gurisingh@paypal.com

Executive summary

I build the AI infrastructure that lets PayPal's autonomous merchant programs ship. Over the last six months I authored five load-bearing systems — **MAIA × Venmo** (the agent that took 84–89-day merchant onboarding to 20-minute demos), **Vireo** (the agent-agnostic telemetry layer that's now the Devmo standard), **claudе-cosmos** (the universal proxy with PII scrubbing + telemetry baked in, used everywhere from Osaurus to Hermes Agent to Agent-0), **Darwin** (the evolution framework that's shipped 71 PRs, 1,020 fossil candidates, 19 judges, and 678 eval examples), and **Mac-in-a-Mac** (PayPal's first macOS-in-macOS substrate, 3× faster iOS UI tests, now hosting Livery + Agent-0). One of these — MAIA — became the **unified PayPal Migration & Upgrade Program** the week after my live executive demo. The others are downstream substrate for what comes next.

I'm applying for Senior Staff Applied AI/ML because the work I'm already doing is Senior Staff Applied AI/ML work — across multiple BUs, with named VP-adjacent sponsorship, productionized, with measurable business outcomes — and because the next set of bets (Darwin productionization, Vireo OTel-native rewrite, claudе-cosmos as the org-wide capture layer) needs the formal scope to ship at the level it can.

Impact — by the numbers

20 min

Live MAIA demo runtime

Down from 84-89 days of Venmo onboarding

3.0×

iOS UI test speedup

PayWithVenmo plan 22m 38s → 7m 23s, Mac-in-a-Mac

9,513

Scored US merchants

Up from 332 in one weekend, 18 harvest campaigns

476

Prime Venmo V1 candidates

Bullseye: simple checkout + PayPal + US + web

71

Darwin evolution PRs

m1 (37) + m2 (34), every PR with eval + video

1,020

Fossil candidates

19 judges · 678 eval examples · cross-milestone lineage

14

Senior leaders at exec demo

Production repos I author

6 PayPal-Venmo + 5 personal EMU

§1 — Senior leader endorsements (verbatim)

Pulled directly from the email and Slack record.

Shama Pagarkar

Senior PayPal leader · Migration & Upgrade Strategy

*"Venmo upgrade should be part of the migration and upgrade strategy that is in the works. **It should not be a separate track.**"*

→ Unified my Venmo MAIA track into a single PayPal-wide program. May 4 2026.

Adil Khan

PM, Pay With Venmo · MAIA demo lead

"Fully aligned, this should be one program. I'll set up next steps with Bo on SMB and Karin on the trust-first UX."

→ Same thread, same day. Pulled in cross-functional UX + GTM.

Byron Ma

Venmo product

"You're going to need to optimize for the developer believing they're in control... we both us and our partner could sleep well at night using this."

→ In-demo, April 29. Trust-first framing now program policy.

Mike Sutter

Venmo product

"Any merchant-initiated change should essentially require them to upgrade to the latest... and the other is also true. Anytime we upgrade, we want to attach Venmo."

→ In-demo decision that became the program's bundling policy.

Jackson Tse

Venmo leadership

"This is all so awesome to see... moving so fast but it's going to be so powerful. Ensuring the trust is going to be super important."

→ Brought Karin Giefer in for the trust UX track.

Nan Li

iOS leadership · Mac-in-a-Mac sponsor

"I love it; I am sold on the performance. I can ask my team to take a look and give you some feedback."

→ Took sponsorship for Mac-in-a-Mac, May 5 2026.

Steve Mask

AI Toolkit lead · Darwin scope partner

"This looks really good! You're killing it!"

→ Explicit AI Toolkit handoff. Darwin co-scoping.

Paul Oglesby

SMB-FS engineer

"This looks fantastic — will take for a spin this week!"

→ Onboarded onto Vireo. SMB-FS adoption signal.

§2 — Scope-and-impact arcs

Arc 1 — MAIA × Venmo: zero to unified PayPal program in three weeks

Status: Productionized. Unified by senior leadership May 4 as the **PayPal Migration & Upgrade Program**.

The compressed timeline. I joined the MAIA × Venmo working group on **April 10**, reverse-engineered the 4-step pipeline (`aim_init_check` → `aim_convert_router` → `aim_correction` → `aim_paypal_ft`), and shipped an initial 320-merchant test bed across 17 platforms and 19 verticals that night. By **April 14** I'd taken that corpus from **332** → **9,513 scored US merchants** across **18 independent harvest campaigns** (CommonCrawl + AWS Athena + specialty hunters: `enterprise_hunter` 686 leads at 96% S-Tier, `legacy_hunter` 746 at 98% exclusive, `mega_r2` 4,016 cross-validation), identified **476 prime Venmo V1 candidates** in the bullseye, built **four interactive D3.js knowledge graphs** (Gateway Ecosystem, Merchant Intelligence, Venmo Opportunity Map, Harvest Lineage), and produced a **1:45 narrated Remotion explainer video** to brief leadership. The Singapore MAIA team had been running on a handful of fixtures with zero real-world telemetry; I gave them ground truth.

By **April 27** I'd written the **injection script** that took MAIA from "works on our pizza-site fixture" to "works on real merchant markup pulled from the wild," and ran the Venmo functional test on a real merchant live in front of Singapore's architects (Huan Chen, Yijun Zhu) to extract commitments on dashboard access, EVAL repo timeline, and skill extensibility. The agenda I authored for Iliya to run the meeting from is in the Slack record verbatim.

On **April 29** I co-executed the executive live demo (Eyes of Texas MTR, Austin, 14 senior leaders required + optional): MAIA took two real V4/V5 merchant codebases, upgraded both to JS SDK V6, enabled Venmo, provisioned sandboxes, and ran functional tests — **all in ~20 minutes on stage**. I authored the friction-bypass toggle that made the demo runnable in time, exposed the "Stay to the plan" hook as the deterministic ring around the

multi-sub-agent autonomy, and instrumented the whole flow with Vireo so post-demo telemetry started flowing immediately ([DTVZ-506](#) was opened May 6 as the direct follow-on).

On **May 4**, Shama Pagarkar unified the program. The Venmo track is no longer a track; it's the canonical Migration & Upgrade Program with SMB-FS (Bo English-Wiczling), LE/GSA (Shalaka Kathapurkar), and trust-first UX (Karin Giefer) folded under it. My epic [DTVZ-374](#) (Project MAIA — Venmo Integration via AI Migration Agent) and its seven P0 children are the program's engineering spine on the Venmo side.

Arc 2 — claude-cosmos: the universal capture layer

Status: Live; sponsored capture surface for Devmo, MAIA, and any agent that needs to reach Cosmos.

What it is: a Claude-flavored proxy that routes any Anthropic-shape request to PayPal's Cosmos LLM endpoints, with **sanitization, PII scrubbing, and telemetry built into the proxy itself**. What it unlocks isn't "Claude on Cosmos" — it's "**any agent, anywhere, instrumented and safe.**" It's the capture surface Vireo's hooks-and-MCP approach cannot reach: short-lived ephemeral runs, hosted webapps, agents inside untrusted containers — anywhere an HTTPS call escapes a local capture surface. Used in production by:

- **Osaurus** (Mac Studio local inference) · **NousResearch Hermes Agent** · **Agent-0** · **Cosmos-IDE** · **Devmo webapp** · **MAIA's network-layer telemetry option** ([DTVZ-506](#))

The conceptual frame I sold internally: **Vireo + claude-cosmos = total observability surface**. Vireo catches what an agent *intends* to do on local CLI/IDE; claude-cosmos catches what every agent actually says *to the model* over the wire. Together: intent + ground truth across local, hosted, ephemeral, and untrusted environments. There's nowhere an LLM call can hide.

Repos: [PayPal-Venmo/claude-cosmos](#), [PayPal-Venmo/cosmos-code-mcp](#) (companion MCP-protocol surface). Jira: [DTVZ-330](#), [DTVZ-331](#).

Arc 3 — Vireo: telemetry + memory for AI dev workflows

Status: Production. Owner of Devmo Workstreams §7 (Telemetry) + §8 (Memory). Cited by name in the Devmo HLD.

Agent-agnostic event capture across four surfaces — **MCP server, CLI (`vireo-send`), shell hooks, skill instructions** — feeding a 33-field schema (4 required: `intent`, `outcome`, `repo`, `tokens_out`) into an n8n ingestion pipeline. From there: events table + daily GitHub archive + hourly distillation into five memory kinds (procedural, failure, preference, semantic, episodic). Repos: `PayPal-Venmo/Vireo`, `PayPal-Venmo/vireo-telemetry`. Jira: `DTPLTM-8222`.

Adoption: I onboarded Paul Oglesby, Sage Vouse, Mauro Lombardi, and the PWV-Bazaar PR/CR-party team via `./start.sh` (2-minute install). MAIA is now using Vireo as its post-demo telemetry substrate — `DTVZ-506` is the canonical follow-on instrumentation epic. Next: OpenTelemetry-native rewrite so Livery / Datadog / Langtrace can consume the same stream.

Arc 4 — Darwin: evolution framework

Status: 71 PRs shipped, AI Labs (Xingchen Hong) onboard, productionization in flight.

The thesis: anything with a prompt in, an output out, and a judge that can score it is GEPA-evolvable. Darwin is the home for that loop: **Evolve** → **Evaluate** → **Preserve** → **Explain** → **Open PR**. Regressions are not failure; they are scientific signal.

The vocabulary I introduced that's now in working use across the team: **Seed** (starting artifact), **Zephyr** (evolutionary run), **Polaris** (North Star objective), **Compass** (judging criteria), **Bloom** (winning candidate), **Fossil** (preserved non-winner), **Garden** (full ecosystem), **Gardener** (Darwin + the humans/agents tending the system).

Concrete output: **71 PRs across two milestones** on `gurisingh_paypal/ai-toolkit-registry-evolved`. Every PR ships with a narrated Remotion video, score table, candidate arena (all fossils + the bloom), judge prompt, eval dataset, and full diff. The fossil record —

every candidate across both milestones — is stored in a graph DB with full-text search:

1,020 candidates · 19 judges · 678 eval examples · cross-milestone lineage tracking.

Doctrinally aligned with [NousResearch's hermes-agent-self-evolution](#) and Imbue's Darwinian Evolver — Darwin is the PayPal-flavored implementation with our own vocabulary, our own GEPA + DSPy pipeline, and our own Cosmos integration. Steve Mask is the scope partner; AI Labs (Xingchen Hong) is the next adoption frontier; Scott Southwood + DT will use it as the upstream signal for Livery's policy system.

Arc 5 — Mac-in-a-Mac: the substrate

Status: Originated by me. Sponsored by Nan Li (May 5). Operationally handed off to Jeffrey Tinnea + DT's Livery.

I shipped PayPal's first macOS guest VM running inside a macOS host (Apple's `Virtualization.framework` + `cirruslabs/tart`) and proved **PayWithVenmo plan 22m 38s** → **7m 23s (3.0× speedup)** with three full xctest-bundle proof runs. From there it became the runtime substrate other AI infra now consumes:

- **Livery (Daniel Thompson)** — isolation-as-the-unlock primitive sits on top of my VM
- **Agent-0** — *"Agent0 on the VM without docker"* (March 10 milestone). Always-on autonomous loop has hardware acceleration + macOS-use control.
- **Jeffrey Tinnea** — picked up lume integration; carrying the operational ownership forward
- **iOS UI test fleet** — every iOS team can shard test plans across host + 1–2 child VMs per Mac mini; 120-test suites become 3 shards of 40

Confluence HLD: page `2860853837` (Draft HLD: Parallel iOS UI Test Execution Using Apple `Virtualization.framework`). Repo: `PayPal-Venmo/apple-virtualization-ci-cd` on `feature/parallel-ui-tests`. Pre-socialized with Nathan Faulkner, Cory Rothert, DT. Sergei brokered. Nan signed on May 5: *"I am sold on the performance."*

§3 — Cross-functional sponsorship and influence

SENIOR LEADER	ORG / ROLE	WHAT THEY SPONSOR
Shama Pagarkar	Migration & Upgrade Strategy	Unified the MAIA program (May 4)
Adil Khan	PM, Pay With Venmo	MAIA demo lead; trust-first program direction
Mike Sutter	Venmo product	Bundle-the-upgrade product policy (in-demo decision)
Jackson Tse	Venmo leadership	Trust-first DX framing
Sergei Kovalenko	Sr Manager / Director	MVP architecture sign-off; Mac-in-a-Mac handoff broker; required attendee at exec demo
Iliya Koreshev	My manager (Sr Manager, SWE — PWV Bazaar)	MAIA telemetry + day-to-day; rehearsed the exec demo 30+ times with me
Steve Mask	AI Toolkit lead	Darwin scope partner; AI Toolkit handoff
Scott Southwood	Devmo lead (Venmo AI Council)	Vireo + Devmo telemetry council
Daniel Thompson (DT)	Livery lead	Livery → Mac-in-a-Mac runtime + Livery → MAIA convergence
Nan Li	iOS leadership	Mac-in-a-Mac sponsor (May 5)
Bo English-Wiczling	SMB-FS lead	SMB self-serve adoption track
Karin Giefer	Design / UX	Trust-first UX track for MAIA
Xingchen Hong	AI Labs	Team adoption of Darwin

§4 — Productionized assets

Public / shipped

ASSET	REPO	SURFACE
DX Sounds (MCP server, AI Hub)	<code>PayPal-Venmo/developer-experience-sounds</code>	8 themes, 14 MCP tools, AI Hub listing
Vireo (telemetry)	<code>PayPal-Venmo/Vireo</code>	MCP + CLI + hooks + skills
vireo-telemetry (backend)	<code>PayPal-Venmo/vireo-telemetry</code>	n8n + storage
claude-cosmos	<code>PayPal-Venmo/claude-cosmos</code>	Anthropic-shape → Cosmos proxy w/ PII scrub
cosmos-code-mcp	<code>PayPal-Venmo/cosmos-code-mcp</code>	Fast MCP for Cosmos
apple-virtualization-ci-cd	<code>PayPal-Venmo/apple-virtualization-ci-cd</code>	macOS-in-macOS substrate + 3× iOS UI test runner

Authored (personal EMU, accessible to collaborators)

ASSET	REPO	SURFACE
Darwin	<code>gurisingh_paypal/darwin</code>	Evolution framework + fossil-record graph DB
ai-toolkit-registry-evolved	<code>gurisingh_paypal/ai-toolkit-registry-evolved</code>	71 PRs Darwin staging
devmo-beta-service PR #1 + #2	<code>gurisingh_paypal/devmo-beta-service</code>	Prompt Enhancer + zero-trust guardrails

ASSET	REPO	SURFACE
paypal-agent-zero	gurisingh_paypal/paypal-agent-zero	Agent-0 fork with SOUL.md + PayPal cert
Cosmos-IDE	gurisingh_paypal/Cosmos-IDE	Local Cosmos-routed IDE wrapper

Strategic artifacts

- **Demo deck: MAIA × Venmo Executive Demo** (Apr 29 2026) — used in the live demo and persisted as the program reference
- **PWV Knowledge Graph** — 38 nodes, 51 typed edges, 15 repos. Three-track framework memo authored Mar 31 in `#v-merchant-sandbox` . `DTVZ-335`
- **Soul Stack framework** — `SOUL.md` + `STYLE.md` + `SKILL.md` for agent persistence (from the "Most Fun with AI" talk)
- **DEVMO DOSSIER — Field Report** (Apr 30 2026) — competitive-intel scan across PayPal+Venmo Slack of every parallel team building AI-SDLC infra (Endzone, Livery, Crew, Bray, Gantry, Athenea, app-zero) plus eight skill registries, with a seven-vector collaboration action plan
- **Mercury 2025 / Hackathon-2025** (`github.paypal.com/gurisingh/Hackathon-2025`) — the autonomous-merchant-business blueprint authored Jul–Aug 2025; in retrospect the imagination doc for everything in H1 FY2026

§5 — Technical depth: selected decisions and trade-offs

A Senior Staff Applied AI/ML role requires evidence of architectural judgment, not just shipping. Five decision points where I authored the call:

1. Why ephemeral bootstrap for MAIA. Singapore's MAIA pipeline uses a per-session ephemeral pattern instead of persistent agent state. After the Apr 27 architecture call with Huan + Yijun, I argued (and the team adopted) that this is intentional — it's a deliberate happy-medium between LLM autonomy and merchant transparency / ownership.

Persistent state is what we'd reach for in a runtime; ephemeral is what we need for a *migration* tool the merchant trusts because they can see every step. Documented in the Apr 28 group DM recap.

2. Why hooks beat prompt-engineering for determinism. The "Stay to the plan" hook inside `.claude/` runs after every tool call and forces the agent back to the original plan. Most multi-sub-agent setups fail because the agent gradually drifts from intent. The hook is a 20-line markdown file that solves the same problem people are throwing 20K-token prompts at. I made this the headline reveal of the executive demo.

3. Why Vireo went local-hot-sink instead of K8s/serverless. Posted to `#v-devmo` May 5 for the team's blessing: *"For richer spans, can we use a local hot sink for reconciliation/backfill, vs doing all that in the resulting databases?"* The trade-off I argued: local-hot sink gives a second chance to scrub PII, redact secrets, and reconcile skill + MCP + subagent context with the LLM span before it leaves the box. Scott Southwood signed off. Sergei + Steve copied.

4. Why claude-cosmos is structurally cleaner than vendor SDKs. Datadog, Langtrace, and similar capture solutions require either a vendor SDK in every app or a side-channel. claude-cosmos requires neither — every LLM call that reaches a Cosmos model *must* traverse it, so the capture is automatic and uniform. Sanitization, PII scrubbing, and telemetry can live in one place, evolve in one place, be audited in one place. This is the same insight the Devmo Security HLD reached independently — convergence is a strong signal.

5. Why Darwin's GEPA + DSPy beats hand-tuned skills at scale. Hand-tuned skills don't have lineage or eval data; you can't tell if version N is better than N-1 except by going back to the author. Darwin's loop preserves every candidate (the Fossil concept) with a judge's rationale and an eval-dataset score, so the next evolution is always informed by the failure modes of the last. After 71 PRs, the fossil record is itself a training signal — and it's already accumulated across 1,020 candidates.

§6 — Leadership and influence

Cross-team evangelism. I converted Jeffrey Tinnea to Agent-0 and Mac-in-a-Mac; onboarded Paul Oglesby, Sage Vouse, and PWV-Bazaar to Vireo; pre-socialized Mac-in-a-Mac with Nathan Faulkner, Cory Rothert, and DT before pitching Nan Li for sponsorship; consulted with Huan Chen + Yijun Zhu (Singapore MAIA architects) on telemetry direction.

Internal landscape work. Authored the *Three-track framework* memo (Mar 31 #v-merchant-sandbox) that explicitly grouped my containerized VM sandbox with DT's harness and Scott's containers as "*essentially the same thing from slightly different angles.*" Authored the *DEVMO DOSSIER — Field Report* (Apr 30 #v-devmo) — a competitive-intel scan across PayPal+Venmo Slack of every parallel team building AI-SDLC infra and every skill registry, with a seven-vector collaboration action plan. This is the kind of integrative work that surfaces convergence opportunities the org would otherwise miss.

Knowledge transfer and handoffs. Actively handing off:

- **Venmo iOS Sandbox DRI** → Peter Ryszkiewicz ([DTVZ-339](#) closed April 15). KT doc drafted; two more sessions planned.
- **Mac-in-a-Mac** → Nan Li's team (sponsorship) + Jeffrey Tinnea (operational extension via lume) + DT (consumer via Livery)
- **MAIA telemetry** → unified PayPal Migration & Upgrade Program ([DTVZ-506](#))
- **PWV Knowledge Graph / OmniGraph** → Three-track framework owners (Puneeth / Jonathan / Diego avoiding overlap)

Handing off well — at the right moment, to named successors, with documentation — is itself Senior Staff signal. I'm doing it now while the work is going well, not later under duress.

Speaking and showcases. Presented "*How to Have the Most Fun with AI*" to Venmo Engineering (VAC) on March 6 2026 — five live demos in 30 minutes, launched FunAI Hack Hour as a recurring forum. Author of the Soul Stack pattern and the "Sonic Confetti" + DX Sounds line of work.

§7 — Why Senior Staff Applied AI/ML

Three reasons, all evidenced above:

1. The scope is already cross-BU and senior-sponsored. The work runs across Venmo, SMB-FS, LE/GSA, AI Labs, and Devmo. The sponsors named at §3 are at Sr Manager → Director → VP-adjacent level. The deliverables are productionized, not prototypes. This is the standard for Senior Staff scope.

2. The technical contribution is foundational, not incremental. Vireo + claude-cosmos together are the org's most complete agent-observability stack. Darwin is the org's most coherent skill-evolution framework. Mac-in-a-Mac is the substrate Livery and Agent-0 both run on. MAIA × Venmo was the demo that unified the migration program. These are platform-engineering outputs, not feature work.

3. The trajectory needs the formal scope to deliver. The next set of bets — Darwin productionization, Vireo OTel-native rewrite, claude-cosmos as the org-wide capture layer, MAIA expanded beyond Venmo via the Migration & Upgrade Program — are platform-engineering bets that benefit from a Senior Staff Applied AI/ML title's clarity on scope and accountability. The work happens either way. The title makes it land cleanly across the org.

§8 — Asks

- A calibration conversation about scope and title progression in the next 1:1 cycle
 - Sanctioned path for collaborators to access the `gurisingh_paypal` EMU namespace (Darwin, ai-toolkit-registry-evolved, paypal-agent-zero, Cosmos-IDE, devmo-beta-service PRs all live there)
 - A sanctioned Gemini service account for the Prompt Enhancer (currently bridged through personal ADC; would prefer the right path before this scales)
-
